

Example: Calculating the probability of topology-unchanged

The probability of topology-unchanged given the branch and timing of recombination:

$$\mathbb{P}(\text{topology-unchanged} | \mathcal{S}, \mathcal{G}, b, t_r) = \begin{cases} \frac{1}{k_i} + \sum_{j \in \mathcal{I}_{bc}} f(i, j) \exp \left\{ \frac{k_i}{2n_i} t_r \right\} + \sum_{j \in \mathcal{M}_b} f(i, j) \exp \left\{ \frac{k_i}{2n_i} t_r \right\}, & \text{if } t_r < t_b^m \\ 2 \left(\frac{1}{k_i} + \sum_{j \in \mathcal{I}_b} f(i, j) \exp \left\{ \frac{k_i}{2n_i} t_r \right\} \right) + \sum_{j \in \mathcal{I}_c} f(i, j) \exp \left\{ \frac{k_i}{2n_i} t_r \right\}, & \text{if } t_r \geq t_b^m \end{cases}$$

In this example, recombination occurs on branch b in interval 0 ($i=0$) at time $t_r=500$, and we will assume all $N_e=1000$. Because $t_r < t_b^m$, we apply the first case above:

$$\begin{aligned} \mathbb{P}(\text{topology-unchanged} | \mathcal{S}, \mathcal{G}, b, t_r) &= \frac{1}{k_i} + \sum_{j \in \mathcal{I}_{bc}} f(i, j) \exp \left\{ \frac{k_i}{2n_i} t_r \right\} + \sum_{j \in \mathcal{M}_b} f(i, j) \exp \left\{ \frac{k_i}{2n_i} t_r \right\} \\ &= \frac{1}{1} + \sum_{j \in \{0,1,2,3,4\}} f(0, j) \exp \left\{ \frac{1}{2(1000)} 500 \right\} + \sum_{j \in \{2,3\}} f(0, j) \exp \left\{ \frac{1}{2(1000)} 500 \right\} \end{aligned}$$

Expand piece-wise constant functions $f(i, j)$ for each interval over branches b and c :

$$\begin{aligned} f(0, 0) &= -\frac{1}{1} \exp \left\{ -\frac{1}{2(1000)} 1000 \right\} \\ f(0, 1) &= \frac{1}{3} \left(1 - \exp \left\{ -\frac{3}{2(1000)} 1000 \right\} \right) \exp \left\{ -\frac{1}{2(1000)} 1000 \right\} \\ f(0, 2) &= \frac{1}{2} \left(1 - \exp \left\{ -\frac{2}{2(1000)} 1000 \right\} \right) \exp \left\{ -\frac{1}{2(1000)} 1000 - \left(\frac{3}{2(1000)} 1000 \right) \right\} \\ f(0, 3) &= \frac{1}{3} \left(1 - \exp \left\{ -\frac{3}{2(1000)} 1000 \right\} \right) \exp \left\{ -\frac{1}{2(1000)} 1000 - \left(\frac{3}{2(1000)} 1000 + \frac{2}{2(1000)} 1000 \right) \right\} \\ f(0, 4) &= \frac{1}{2} \left(1 - \exp \left\{ -\frac{2}{2(1000)} 1000 \right\} \right) \exp \left\{ -\frac{1}{2(1000)} 1000 - \left(\frac{3}{2(1000)} 1000 + \frac{2}{2(1000)} 1000 + \frac{3}{2(1000)} 1000 \right) \right\} \end{aligned}$$

Yields a final result (colored to correspond with the figure above):

$$\begin{aligned} &= 1 + (-0.6065 \times 1.284) + (0.1571 \times 1.284) + (0.0428 \times 1.284) + (0.0129 \times 1.284) + (0.0035 \times 1.284) + (0.0428 \times 1.284) + (0.0129 \times 1.284) \\ &= 0.5703 \end{aligned}$$
